

4 common business problems solved with SysCloud

MOBILITY

The traditional workplace environment has transformed and how we access our data has transformed with it. The flexible working environment is here to stay, which brings a greater need to be connected and access our data through various devices and platforms. With SysCloud, there is no need for onsite infrastructure, meaning you can access company tools, data and collaborate whenever and wherever you are – allowing for a more adaptable work style that can prove to enhance productivity.

SCALABILITY

A growing business will inevitably come to the realisation that they need to expand their infrastructure. This usual lengthy, expensive process of trawling through hefty quotes and hardware options is completely eliminated with SysCloud. We give you the freedom to scale up with the click of a button, with a dedicated private platform monitored by us. We also understand that scalability is an important factor and having the ability to adapt throughout the year is essential. For example, seasonal events effecting retailers. You will only pay for what you need and can scale up with little disruption to your business operations.

COMPLIANCE

For those businesses that have already taken the leap to the cloud, storing their own and customer data off site comes with GDPR compliance and UK sovereignty responsibility. With SysCloud, you can have your own dedicated platform, right here in the UK. Mid-market organisations are turning to SysCloud to ensure their data remains fully compliant, as public cloud providers will likely move your data to be stored outside the UK, unless you have made special provision. SysCloud operates through data centres within the UK, giving you the reassurance that your data stays and abides by UK law and sovereignty.

MAINTENANCE

We all know that downtime = loss, and if you have physical infrastructure on site, its maintenance can prove costly. Hiring a technician to fix any issues will cost you time and money, not to mention the costs of updating yearly warranties and refreshing equipment. With SysCloud, we host your network meaning the monitoring and maintenance is managed by us, allowing you the time to focus on what you do best. As cloud experts we pride ourselves on our ability to act rapidly, allowing your business to run smoothly in safe hands.
